

Dyllan Ostenson

Senior Software Engineer | Performance Engineering & Algorithms

+1 646 543 0546 · dyllanostensondev@gmail.com · <https://github.com/radoicic> · Beloit, Wisconsin, United States

PROFESSIONAL SUMMARY

Senior software engineer with 12+ years architecting performant full stack systems for SaaS and platform-scale products. Strength in algorithm design, Python and C++ services, and tuning data-intensive pipelines for throughput, latency, and efficiency. Partners with architecture, research, and application teams to validate designs through benchmarking and reference code. Delivers AI-enabled platforms, mentors engineers on complexity-aware engineering, and drives measurable production performance gains.

WORK EXPERIENCE

Senior Software Engineer

Aug/2022 - Mar/2026

TechCrunch

Remote | San Francisco, CA

- Optimized **core data processing algorithms** across distributed services, reducing p95 pipeline latency by **38%** through profiling, batching, and **memory-aware data structure** redesign.
- Partnered with **application and platform teams** to diagnose production bottlenecks and deliver **reference implementations** that improved integration efficiency for 15+ internal developer consumers.
- Built **Python and C++ utility libraries** for numerical aggregation and transform pipelines supporting high-volume editorial and analytics products.
- Architected **concurrent job orchestration** patterns for batch and streaming workloads, increasing throughput capacity by **2.4x** without additional infrastructure spend.
- Influenced **next-generation service architecture** by publishing benchmark analyses and design proposals adopted across three platform squads.
- Led **technical mentorship** for six engineers on complexity analysis, profiling tooling, and **performance regression** prevention in CI pipelines.
- Designed **API contracts and SDK patterns** simplifying integration for external developers while maintaining backward compatibility across 40+ endpoints.
- Collaborated with **research and data science** stakeholders to productionize ML inference workflows with observability guardrails for model drift.

Senior Fullstack Engineer

Oct/2020 - Jul/2022

Golden Technology

Remote | Glendale, OH

- Owned **end-to-end performance tuning** for a multi-tenant SaaS platform serving 200K+ monthly users, cutting page load time by **45%**.
- Implemented **parallelized ETL pipelines** in Python processing millions of records nightly with fault-tolerant checkpointing and idempotent retries.
- Refactored legacy monolith modules into **modular services** with clear algorithmic boundaries, improving deployment frequency from monthly to weekly.
- Established **code review standards** emphasizing asymptotic efficiency, caching strategy, and database query plan optimization across the engineering org.
- Built **real-time notification** subsystems using event-driven architecture with sub-100ms delivery for critical workflow alerts.
- Mentored three junior developers on **data structures**, distributed trace debugging, and structured production incident response.
- Drove cross-team alignment with product and QA on **release prioritization**, reducing production defects by **30%** over two quarters.
- Introduced **automated load testing** in CI/CD that caught regressions pre-release and documented performance baselines per service.

Fullstack Developer

Jun/2018 - Sep/2020

IgniteTech

Remote | Austin, TX

- Developed **RESTful APIs** in Node.js and Python supporting core product features used by 50K+ registered accounts.
- Optimized **database query patterns** and indexing strategies that reduced average API response time by **25%**.
- Built responsive **React dashboards** with efficient state management for data-heavy operational views.
- Contributed to **search and ranking algorithms**, implementing client-side and server-side filtering logic with measurable relevance gains.
- Automated deployment workflows with **Docker and Jenkins**, shortening release cycles from days to hours.
- Collaborated with remote stakeholders across time zones to deliver scoped features with documented edge cases and test coverage.

Frontend Developer

Feb/2014 - May/2018

Duda

Onsite | Louisville, CO

- Delivered **high-traffic marketing site components** in JavaScript and CSS used across thousands of customer-published pages.
- Improved **render performance** via lazy loading, asset bundling, and DOM-efficient templates, boosting Lighthouse scores by **20 points**.
- Integrated third-party analytics and **A/B testing tooling** enabling data-driven iteration on conversion-focused UI patterns.
- Partnered with designers to translate wireframes into **accessible, cross-browser** interfaces meeting WCAG guidelines.
- Maintained legacy jQuery modules while incrementally migrating features to **modern component patterns** without disrupting customer sites.

EDUCATION

Georgia Institute of Technology

Bachelor's degree in Information Technology

2018-2013

SKILLS

Frontend: React, TypeScript, JavaScript, HTML5, CSS3, Redux, Webpack, Responsive UI

Backend: Python, C++, Node.js, Express, REST APIs, GraphQL, Microservices

Databases: PostgreSQL, MongoDB, Redis, Elasticsearch, Query Optimization

Cloud & DevOps: AWS, Docker, Kubernetes, CI/CD, Terraform, Linux

Monitoring & Tools: Prometheus, Grafana, Datadog, Git, Profiling Tools, NumPy

Workflow & PM: Agile/Scrum, Jira, Confluence, Technical Documentation, Cross-functional Leadership

CERTIFICATIONS

- Google Analytics Individual Qualification

PROJECTS

Healthcare Platform (AI-Driven, HIPAA-Compliant System)

- Engineered a **HIPAA-compliant AI-driven** diagnostic workflow platform processing sensitive imaging metadata with encryption at rest and audit logging.
- Built **Python microservices** for model orchestration and feature extraction with strict latency SLOs for clinical review paths.
- Implemented **role-based access controls** and compliance guardrails supporting multi-facility deployments.

Shipment & Logistics Platform (Real-Time Tracking System)

- Developed a **real-time tracking system** with WebSocket feeds and geospatial aggregation for fleet visibility across 10K+ daily shipments.

- Optimized **route calculation algorithms** and caching layers reducing ETA computation time by **35%**.
- Designed a scalable **event ingestion pipeline** handling burst traffic during peak logistics windows.
